

Role of Color in Telemedicine Applications

Elizabeth A. Krupinski, PhD

THE UNIVERSITY OF ARIZONA
MEDICAL CENTER

Medical Imaging

Background

- **Color displays common clinical practice**
- **Radiology growing acceptance & use**
- **Other “ologies” & telemed routinely used**
- **No validated color display calibration protocol for *medical* color image applications**
- **No universally accepted image quality program for color displays in medicine**
- **Significant lack data showing that poor/inappropriate calibration affects diagnostic performance &/or workflow**

Telerad & Color

- **Color routine CT, MRI, US but what about bone, chest, mammo?**
- **Diagnostic accuracy & visual search efficiency high luminance (400 cd/m²) MG color equivalent to high luminance (400 cd/m²) MG monochrome display?**
- **Yes = MG color displays can be used as all-purpose diagnostic displays**

Krupinski et al. (2011). High luminance monochrome vs color displays: impact on performance & search. Proc SPIE Med Imag 7966 79661RI-6

Images

- **50 DR chest images**
- **Half solitary pulmonary nodule half without**
- **Locations confirmed DR & CT images**
- **Nodules size = 9 – 26 mm**
- **Shape = round or round with spiculations**
- **Subtlety = subtle to moderately subtle**

Displays

- **Eizo MG 3-Mpixel monochrome**
- **Eizo MG 3-Mpixel color**
- **Portrait mode**
- **Calibrated to DICOM GSDF**
- **Pixel pitch:**
 - color = 0.21075 mm**
(323.7 x 431.6 mm Diagonal: 540 mm)
 - monochrome = 0.2115 mm**
(324.8 x 433.1 mm Diagonal: 541 mm)
- **Max luminance = 400 cd/m²**
- **Min luminance = 0.75 cd/m²**

Study Details

- **6 radiologists view images each display**
- **Counterbalanced min 3 wks between sessions**
- **Ambient room lights = 25 lux**
- **Viewing distance ~ 45 cm**
- **Window & level allowed**
- **Report nodule present or absent & rate confidence definite, probable, possible**
- **MRMC ROC used to analyze**
- **Total viewing time recorded**

Eye-Position Study

- **Separate session viewed sub-set 15 images**
- **Eye-position recorded using 4000SU Eye-Tracker with head tracker**

Diagnostic Accuracy

No significant difference color vs mono

- **F = 0.0136, p = 0.9078**

Reader	Color Az	Monochrome Az
1	0.9209	0.9031
2	0.8913	0.8964
3	0.9002	0.8294
4	0.9455	0.9097
5	0.8597	0.9097
6	0.8710	0.9187
Mean	0.8981	0.8945

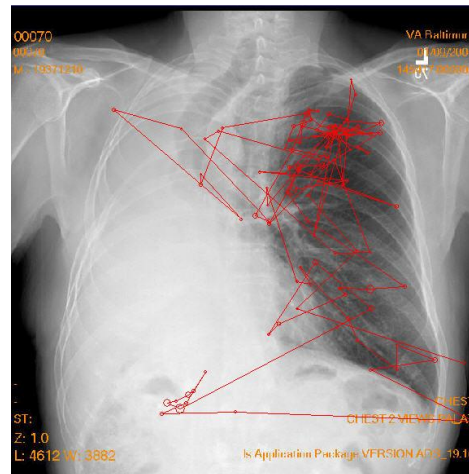

Total Viewing Time

No significant differences color vs mono

- **F = 0.392, p = 0.5315**

Typical Search Patterns

Red dots = fixation or location eye lands foveal vision

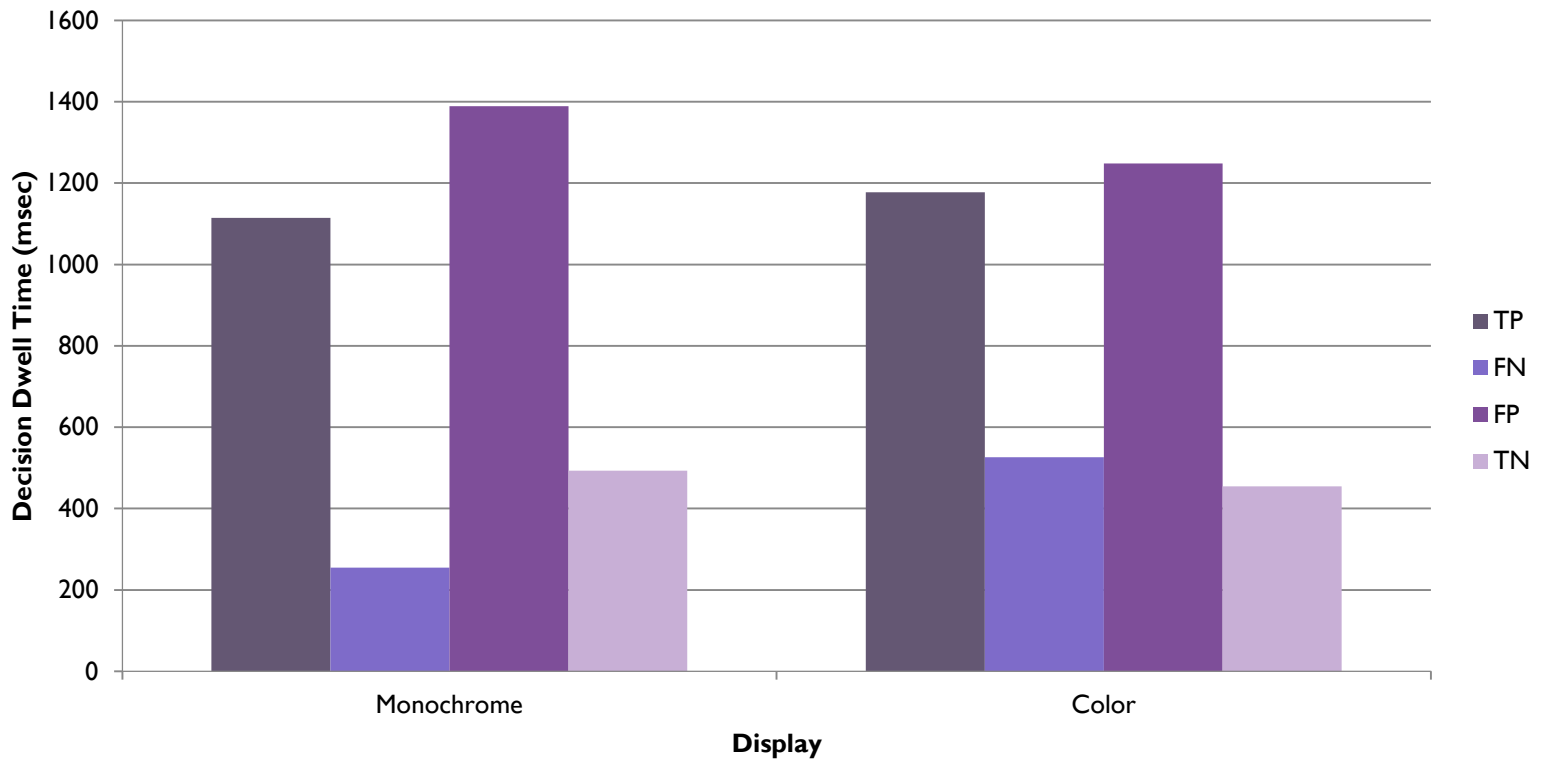

Size circle = dwell time: larger = longer dwell

Lines = order fixations generated during search

Decision Dwells

No significant differences color vs mono

- **F = 0.133, p = 0.7154**

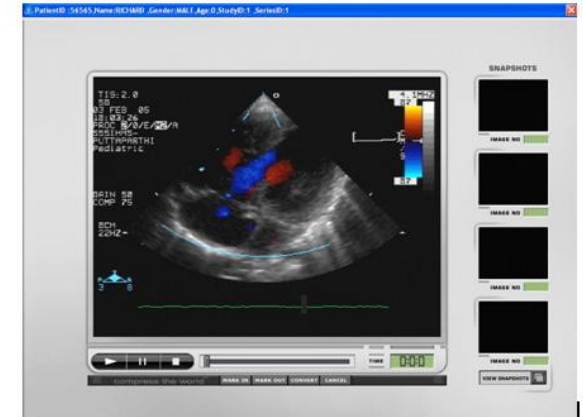

Summary

At least for task detecting chest nodules diagnostic accuracy & visual search efficiency equivalent using 3-Mpixel MG color & monochrome LCD displays

Common TM Applications

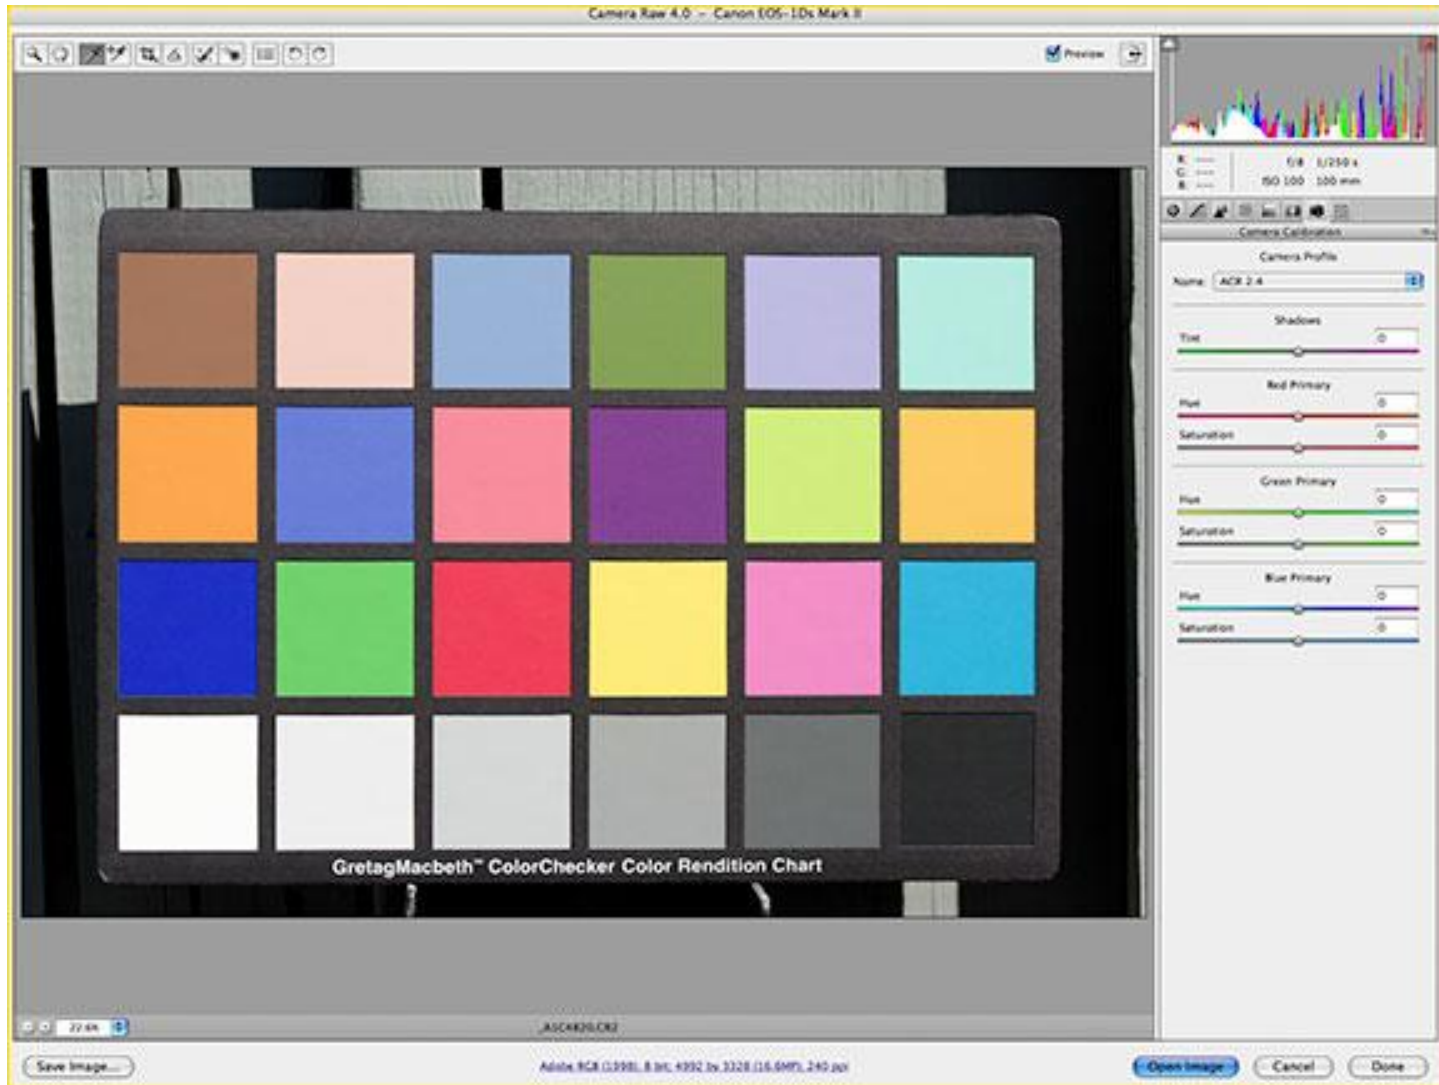

Common Calibration Tools

CLOSE ENOUGH

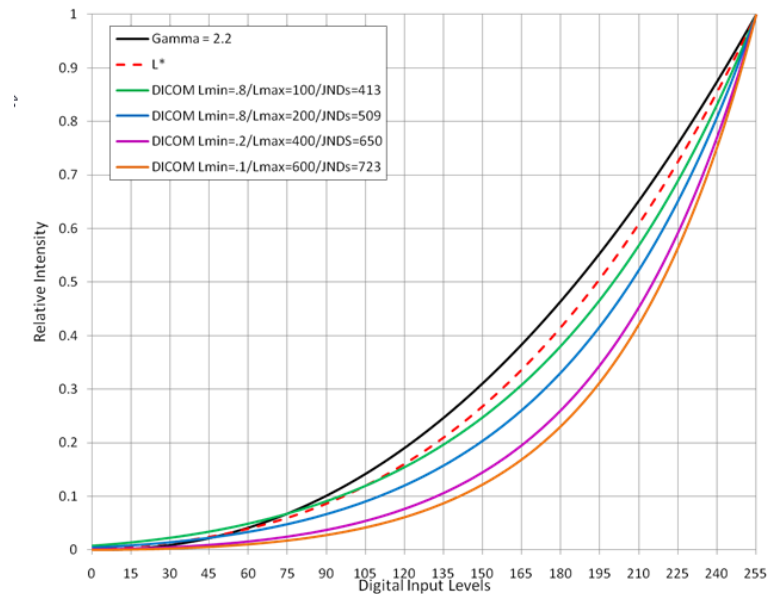

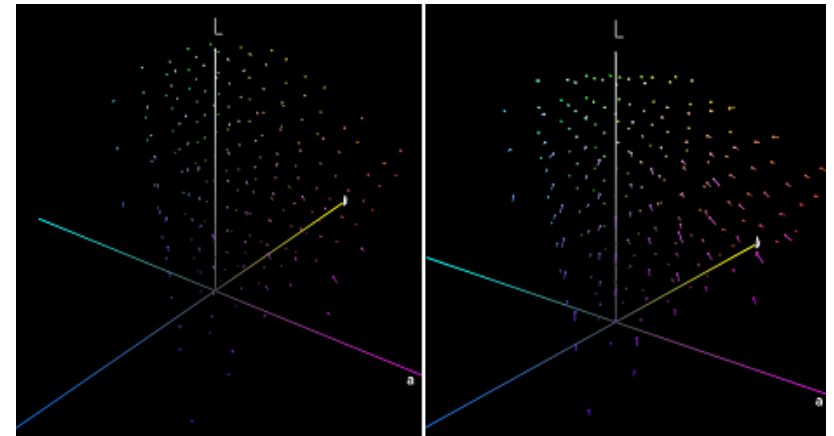

Common Calibration Tools

Less Common Tools

Rarely Used Methods

What About the Users?

- **Improved understanding human observers**
 - **Reduce errors**
 - **Develop better training tools**
 - **Improve workflow**
- **Improve image presentation**
 - **Develop better displays, calibrations, tools etc.**
 - **Intelligent compression**
 - **Tailored computer processing & decision tools**
 - **Better navigation tools**
 - **Streamlined retrieval, display & reporting tools**

Early Studies

- **Teledermatology SF = In-person?**
 - 308 dermatology cases from IP
 - Digital photos 832 x 608, 24-bit
 - 3 dermatologists (intra & inter)
- **83% diagnostic concordance**
- **62% very definite or definite**
- **Image sharp 83% good/excellent**
- ***Image color* 93% good/excellent**

Krupinski et al. (1999). Diagnostic accuracy & image quality using digital camera for teledermatology. TMEH 5;257-263.

Recent Studies

Calibration, Characterization & Profiling

Silverstein et al. Achieving High Color Reproduction Accuracy in LCDs for Color-Critical Applications. JSID 2012;20:53-62

Experimental Setup

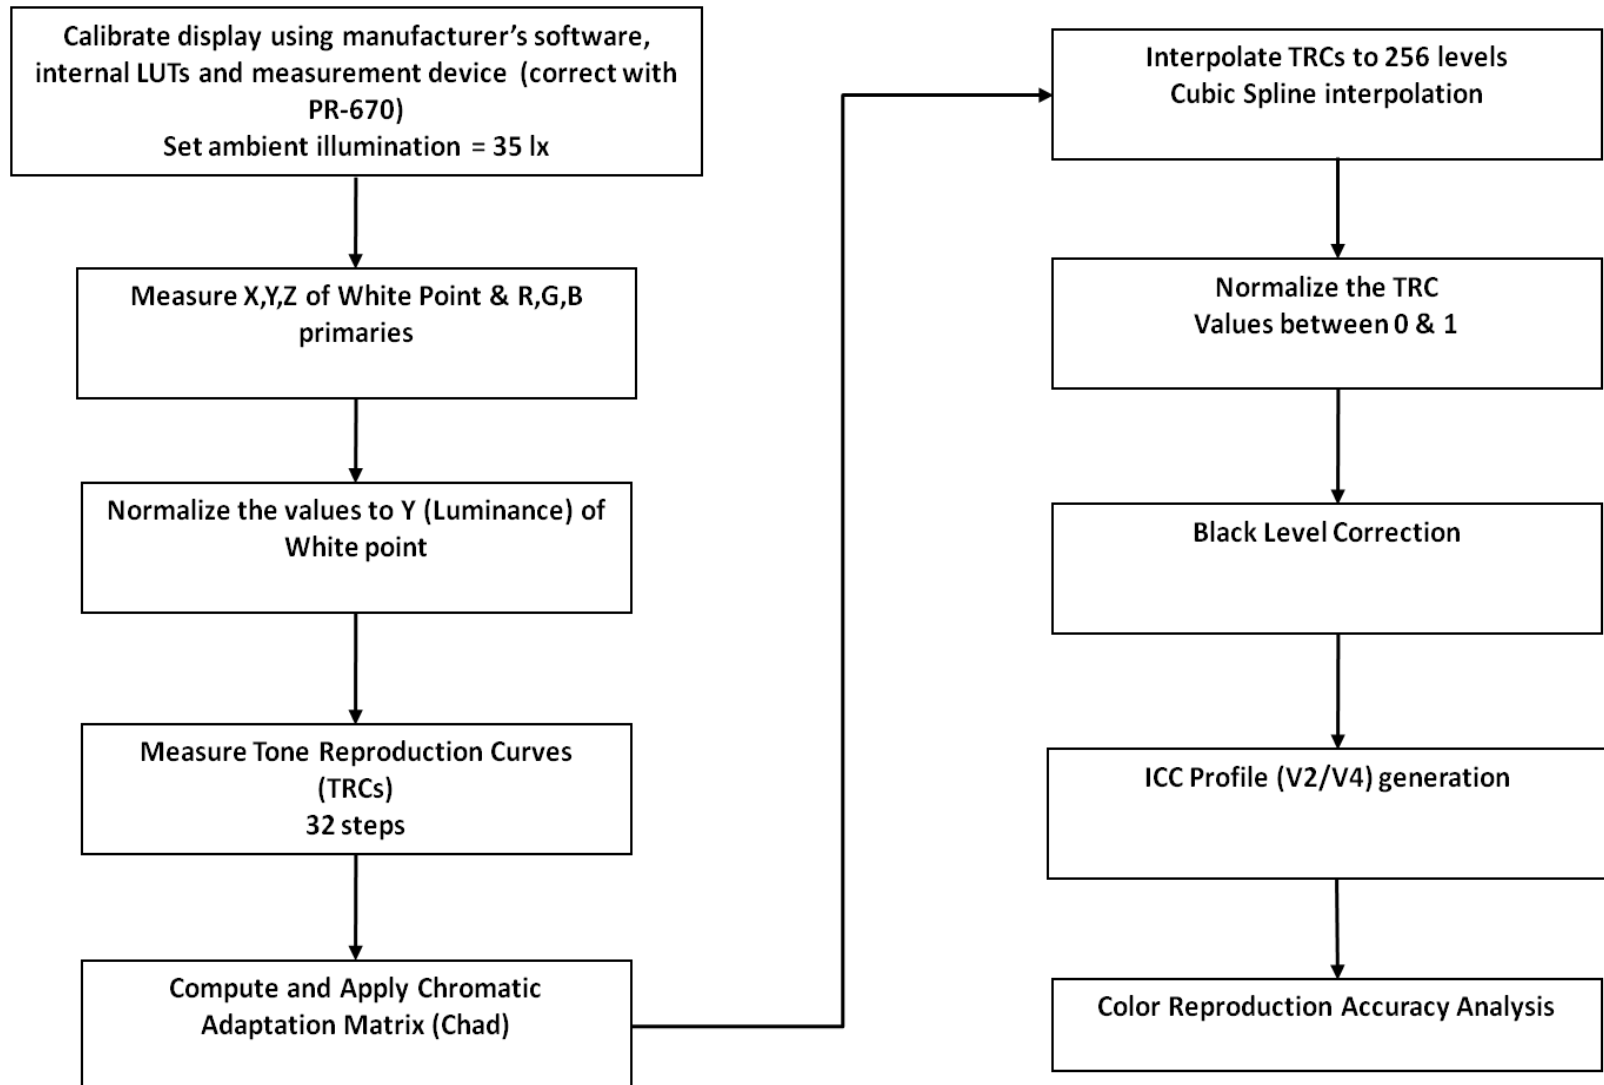

Primary Monitor

Pr 670 Spectrophotometer

Display Under Test

Calibration, Characterization & Profiling

Methods

- **MatLab module evaluates color reproduction accuracy using display characterization & ICC profile**
- **Sets test colors generated taking intersection uniform sampling CIE Lab color space axes with reference color space (sRGB)**
- **Set 210 test colors created**

Uncalibrated

Calibrated

Does It Matter?

- **Whole slide images DMetric scanner**
- **Breast biopsy specimens**
- **250 ROIs selected by expert pathologist**
 - **1/2 malignant & 1/2 benign**
- **Independently graded 2nd pathologist excellent or good quality**

Study Methods

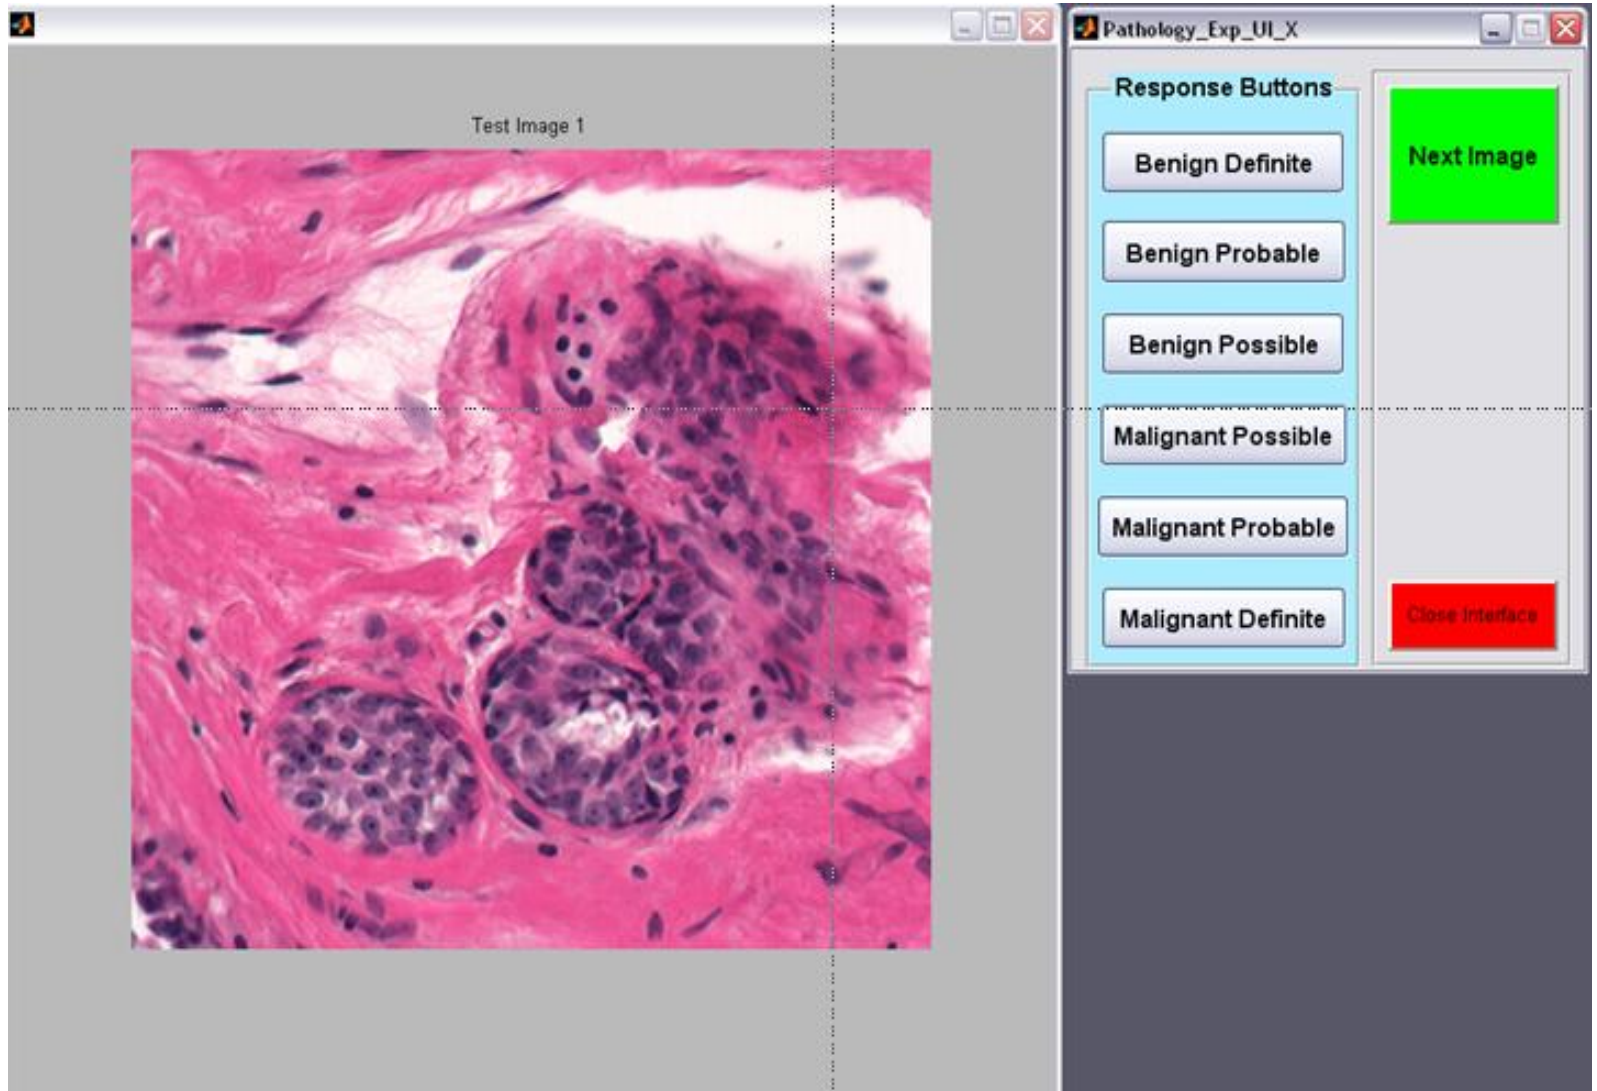

- **6 pathologists – 2 Board certified, 4 residents**
- **NEC 2690 Color LCD**
 - 1920 x 1200
 - $L_{max} = 320 \text{ cd/m}^2$
 - Contrast ratio = 1000:1
 - Wide gamut
 - Calibrated/color managed & off-the-shelf
- **Counterbalanced min 3 weeks between**
- **Rate benign vs malignant**
- **Trials timed automatically**

Ishihara's Test Color Deficiency

Interface

MRMC ROC Az

Reader	Uncalibrated Az	Calibrated Az
1	0.9003	0.9142
2	0.9747	0.9856
3	0.8235	0.8586
4	0.7827	0.7884
5	0.8098	0.7889
6	0.8015	0.8062
Mean	0.8488	0.8570

F = 0.71 p = 0.4112

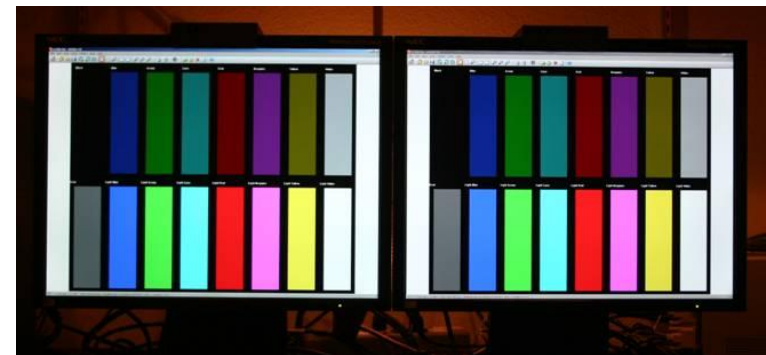

Timing Results

Average 4.895 sec vs 6.304 sec $p = 0.0460$

Conclusions

- 1st study examine impact calibrating/color managing displays on diagnostic accuracy & interpretation efficiency
- Diagnostic accuracy equivalent
- Interpretation speed significantly slower
- Unless viewed side-by-side do not notice differences

ATA Guidelines Derm

- ***Image acquisition:*** device should allow \geq 24 bits color; set white balance; attach calibration label (GreTag) at least 1 image (pref all)
- ***Image display:*** max/min luminance, gamma (2.2), white point, color temp 6500 K, bit-depth 24, ambient 20-40 lux; if GreTag doesn't match adjust using display settings function &/or calibration software tools

ATA Guidelines DR

Monitors & settings should be validated for clinical diagnostic accuracy. Any validated monitor technology can be used (e.g., cathode ray tube, liquid crystal display, gas plasma panel). Retinal images used for diagnosis should be displayed on high-quality monitors of appropriate size and resolution. Displays should be calibrated regularly to ensure fidelity with original validation display conditions. Re-validation should be performed if settings are changed. Ambient light level, reflections and other artifacts should be controlled to ensure standardized viewing.

ACR Electronic Practice

White point: The color characteristics of a display with respect to the presented color space are not considered in this technical standard. However, the white point associated with presentation of grayscale images is important for medical imaging systems. It is recommended that monitors be set to a white point corresponding to the CIE daylight standard D65 white point. This corresponds to a color temperature of about 6,500 °F.

When is Color Important?

- **Color displays (MG & COTS) quite good now**
 - **Luminance, noise, stability etc.**
 - **Cost reasonable even MG**
 - **Calibration tools exist – should be used!**
 - **Diagnostic accuracy & workflow affected little**
- **Humans vs computers!**
 - **Image processing & analysis tools require more color fidelity, calibration, color management**

Automatic Analyses

- **Automatic tissue classification**
 - **Diagnostically Relevant (B or M) vs. Irrelevant**
 - **Application: Efficient region-of-interest compression for faster digital workflow**
 - **Benign vs. Malignant**
 - **Application: Computer-aided diagnosis**
- **Task-driven saliency**
 - **Predict regions most likely to attract *expert* attention**
 - **Application: Efficient region-of-interest compression for faster digital workflow**

H&E Color Transformation

- Isolate info on nuclei & cytoplasm
 - Pixelwise color transform **CMY** -> **HE**
 - **H** shows nuclei, **E** shows cytoplasm, etc.

**Pixel distribution
CMY color space**

CMY

**H (nuclei
dark)**

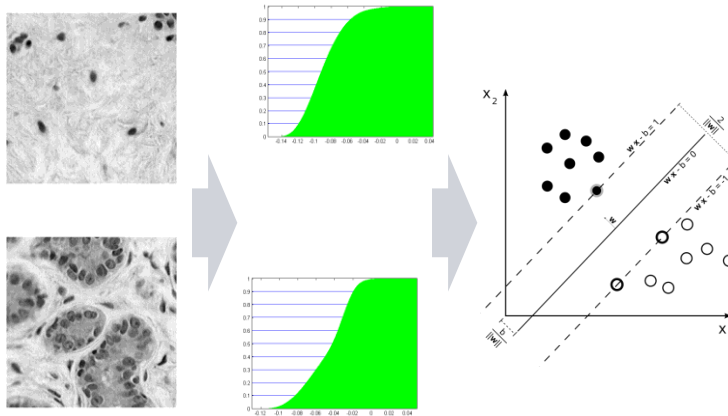

**E (cytoplasm
dark)**

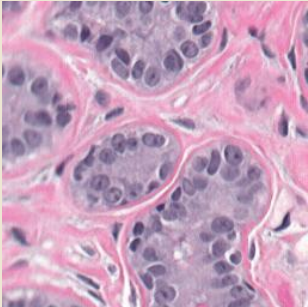

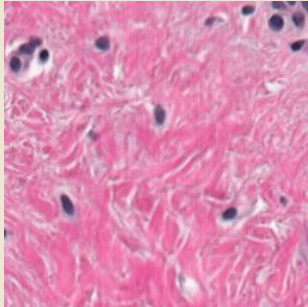

Relevant vs. Irrelevant

- **Requirements**
 - **Computationally efficient**
 - **100% detection Relevant (True Positive), certain false alarm rate permissible**

- **Methodology**

- **Performance**
 - **Accuracy: 98.8 % cross-validation EER on 400 cropped images**
 - **Speed: 10 min 4GB slide, can be sped up**

Relevant	Irrelevant
	
↑ Epithelial nuclei & Tubule formation	↓ Epithelial nuclei & Tubule formation
↓ Cytoplasmic tissue	↑ Cytoplasmic tissue

A dramatic sunset or sunrise over a landscape. The sky is filled with vibrant orange and red clouds, transitioning to a darker blue at the top. The foreground shows the dark silhouettes of hills, trees, and two tall, thin structures, possibly chimneys or towers, against the bright horizon.

THANK YOU!
